

😂 Welcome to the document that most people skip... and then spend weeks fixing inconsistent UI.

This one is basically the rulebook for how every screen should look. If Replit Agent follows it, you'll avoid the classic "every page looks like it was made by a different person" problem.

Assignment Guy

Document 9

Design Tokens & Component Library

Version 1.0

1. Purpose

This document defines the visual rules that every screen and component must follow.

The objective is consistency.

Every button, card, icon, input field, and screen should feel like it belongs to the same application.

If a new screen is added later, it should naturally fit into the existing design system.

2. Design Philosophy

The interface should feel:

Calm

Spacious

Modern

Professional

Trustworthy

Students should focus on assignments, not the interface.

3. Spacing System

Use an 8px spacing grid throughout the application.

Common spacing values:

4px (very small)

8px (small)

16px (standard)

24px (comfortable)

32px (large)

48px (section spacing)

Avoid random spacing values.

4. Border Radius

All interactive components should use rounded corners.

Suggested values:

Small elements: 8px

Inputs & buttons: 12px

Cards: 16px

Bottom sheets & dialogs: 20–24px

Avoid sharp square corners unless intentionally representing a divider or table.

5. Elevation & Shadows

Use subtle shadows.

Cards should appear slightly raised.

Avoid heavy drop shadows.

Depth should communicate hierarchy, not decoration.

6. Typography Scale

Use one font family throughout the app.

Hierarchy:

Display Title

Page Title

Section Heading

Card Title

Body Text

Secondary Text

Caption

Maintain consistent line heights and font weights.

7. Color System

Primary Color

Blue

Neutral Palette

White

Off-white

Light Gray

Medium Gray

Dark Gray

Black

Semantic Colors

Green → Success

Orange → Warning

Red → Error

Blue → Information

Never use color alone to communicate meaning—combine it with icons or text.

8. Icons

Use a single professional icon library throughout the app.

Icons should:

Have consistent stroke weight.

Be visually balanced.

Match the rounded design language.

Avoid mixing icon styles.

9. Buttons

Primary Button

Filled.

Rounded.

Used for the main action on a screen.

Examples:

Upload

Publish

Save

Secondary Button

Outlined.

Used for alternative actions.

Text Button

Minimal emphasis.

Used for low-priority actions.

Destructive Button

Red.

Reserved for deletion or irreversible actions.

10. Input Fields

Every input should have:

Label

Placeholder

Validation state

Error message (when needed)

Support:

Focus state

Disabled state

Error state

Success state

11. Cards

Cards are the foundation of the UI.

Each card should have:

Rounded corners

Comfortable padding

Clear visual hierarchy

Consistent spacing

Avoid placing unrelated information in the same card.

12. Assignment Card

Each Assignment Card displays:

Course code

Assignment title

Due date

Time remaining

Attachment indicator

Discussion count

Verification badge (if applicable)

The entire card should be tappable.

13. Badges

Badges communicate status at a glance.

Examples:

Active

Due Today

Overdue

Verified

Trusted Contributor

Closed

Badges should be small, readable, and color-consistent.

14. Avatars

Circular.

Support:

Profile photo

Initials fallback

Avoid large profile pictures that distract from assignment content.

15. Bottom Navigation

Always contains exactly four items:

Home

Courses

Notifications

Profile

The active tab should be visually distinct.

16. Floating Action Button (FAB)

Position:

Bottom-right.

Purpose:

Upload Assignment.

Always visible on primary screens.

Should remain one of the most recognizable elements in the app.

17. Dialogs

Use dialogs for:

Delete confirmation

Report confirmation

Logout

Important warnings

Dialogs should never be used for long forms.

18. Bottom Sheets

Use bottom sheets for:

Filter options

Sort options

Upload type selection

AI provider selection

They should feel lightweight and easy to dismiss.

19. Loading Components

Preferred loading indicators:

Skeleton cards

Progress bars

Circular loader only for short waits

Avoid full-screen loading whenever possible.

20. Empty States

Every empty screen should include:

Friendly illustration (optional)

Short message

Primary action

Example:

"No assignments available."

"Upload the first one."

21. Error States

Error screens should answer three questions:

1. What happened?

2. Why?

3. What can the user do next?

Never leave users without a recovery path.

22. Animation Guidelines

Animations should:

Be fast

Be subtle

Reinforce actions

Examples:

Card fade-in

Bottom sheet slide-up

Button press feedback

Success check animation

Avoid unnecessary motion that slows interaction.

23. Accessibility

Every interactive element should:

Be reachable with one hand on most phones.

Have sufficient touch size.

Have accessible labels.

Support screen readers.

Accessibility is a requirement, not an enhancement.

24. Responsiveness

Design for:

Small Android phones

Large Android phones

Future:

Tablets

Desktop

Layouts should adapt gracefully without redesign.

25. UI Consistency Checklist

Before releasing any screen, confirm:

Consistent spacing

Consistent typography

Consistent colors

Consistent icons

Consistent button styles

Rounded components

Readable text

Clear hierarchy

No unnecessary clutter

If any answer is "No," revise the design.

26. Component Library (Version 1)

The following reusable components should be created:

Primary Button

Secondary Button

Text Button

Assignment Card

Course Card

Status Badge

Verification Badge

Notification Card

Profile Card

Search Bar

Input Field

Text Area

Upload Card

Attachment Preview

Bottom Sheet

Confirmation Dialog

Empty State

Error State

Loading Skeleton

Floating Action Button

Comment Card

Reply Card

Every screen should be built from these reusable components instead of creating new styles repeatedly.

27. Final Design Rule

If a developer creates a new component, they should first ask:

> Can an existing component be reused or slightly extended instead?

Consistency is more valuable than novelty.

End of Document 9

Final Thoughts Before the Last Document

We're now at the last major document.

Everything we've written so far describes what Assignment Guy is and how it should work.

The final document is different.

It will answer:

> "How do I instruct Replit Agent to build this without messing it up?"

It won't just be a prompt. It'll include:

Build order

Constraints

Coding standards

UI rules

Things the AI must never do

Milestones

Testing checklist

Deployment guidance

Think of it as the instruction manual for your AI developer. If written well, it should greatly reduce the amount of back-and-forth needed to get a solid Version 1.
