

Good catch. 😊 That's actually something we didn't explicitly include, and I think it deserves to be part of Version 1.

It shouldn't be hidden inside the app settings either, because feedback is one of the most valuable things you'll get during the MVP stage.

I'd add a new feature:

Feedback

Purpose:

Allow students to report bugs, suggest improvements, request features, and share general feedback.

Types:

🐛 Bug Report

💡 Feature Suggestion

😞 UX/UI Issue

⚠️ Incorrect Information

★ General Feedback

Fields:

Category

Title

Description

Screenshot (optional)

Device information (optional)

This goes to an admin dashboard for review.

Since Version 1 is all about learning from users, feedback is actually one of the most important features.

I also thought of another small feature

Inside every assignment:

"Was this assignment helpful?"

👍 Yes

👎 No

It sounds tiny, but over time you'll learn which uploads are actually useful and which need improvement.

About Replit

This is where I wanted to stop you from making a common mistake.

Don't just dump all ten documents into Replit and say:

> "Build this."

It can work, but it's not the best approach.

Instead, we'll create one final document called something like:

> Assignment Guy – Replit Agent Build Guide

Think of it as the master instruction manual.

It will tell Replit:

What the project is.

Which documents exist.

Which document is the source of truth if there are conflicts.

What Version 1 includes.

What it must not build.

UI rules.

Coding rules.

Folder structure.

Development order.

Milestones.

Testing requirements.

Then you upload the entire project folder:

Assignment Guy/

01 - Product Requirements Document

02 - UX Specification

03 - UI Design System

04 - Technical Design Document

05 - Database Design

06 - API Specification

07 - Version 1 Scope

08 - Version 2 Roadmap

09 - Design Tokens

10 - Replit Agent Build Guide

The Build Guide tells Replit how to read the other nine documents.

One thing I definitely want to add

I want the Build Guide to include a section called:

When in doubt...

For example:

If there's a conflict:

1. Version 1 Scope wins.
2. PRD wins over UX.
3. UX wins over UI.
4. UI wins over implementation guesses.
5. Never invent features.
6. Ask before changing requirements.

That alone can prevent a lot of AI drift.

I also have one more document I'd like to sneak in, even though I originally said ten.

Document 11 – Change Log

Every time you change the project, add an entry like:

Version 1.0.1

Added Feedback System.

Reason:

Needed a way to collect user suggestions.

or

Version 1.2

Emergency Answer now requires community contribution instead of weekly usage limits.

After six months of development, you'll be amazed how often you ask yourself, "Why did I change this?" A changelog gives you that history.

So I think we'll end up with 11 documents, and honestly, I think that's the right number. Together they'll serve as a complete blueprint for Assignment Guy, whether you're using Replit Agent, another AI coding tool, or building Version 2 yourself.
