

Perfect. This is one of the documents that will matter the most if you're using Replit Agent. It prevents the app from looking like a generic AI-generated website.

Assignment Guy

Document 3

UI Design System

Version 1.0

1. Design Philosophy

Assignment Guy should feel:

Clean

Modern

Fast

Minimal

Professional

The interface should reduce stress rather than add excitement.

Students already feel enough pressure because of assignments.

The UI should feel calm.

2. Visual Identity

The app should communicate:

Organization.

Trust.

Simplicity.

Clarity.

Community.

Everything should support those values.

3. Design Style

Avoid flashy designs.

Avoid unnecessary gradients.

Avoid oversized illustrations.

Avoid excessive animations.

Prefer clean spacing.

Rounded components.

Simple layouts.

Modern typography.

4. Overall Theme

Modern academic.

Think:

Google Calendar

Notion

Linear

GitHub

Discord (organization, not appearance)

The goal is productivity.

5. Color Palette

Primary

Blue

Purpose:

Primary actions

Links

Selected tabs

Important buttons

Neutral Colors

White

Light Gray

Dark Gray

Black

Most of the interface should use neutral colors.

Status Colors

Green

Completed

Blue

In Progress

Orange

Due Soon

Red

Overdue

Gray

Archived

Use colors consistently throughout the app.

6. Typography

Use a clean sans-serif font.

Hierarchy

Large

Page Titles

Medium

Section Titles

Regular

Body Text

Small

Metadata

Avoid decorative fonts.

Readability is the priority.

7. Spacing

Whitespace is a feature.

Every screen should breathe.

Consistent spacing everywhere.

Avoid crowded interfaces.

8. Cards

Most content appears inside cards.

Examples

Assignment Cards

Discussion Replies

Notifications

Course Cards

Cards should have:

Rounded corners

Soft shadow

Comfortable padding

Clear separation

9. Buttons

Button Types

Primary

Filled

Main action.

Secondary

Outlined

Alternative action.

Text Button

Small actions.

Danger

Red.

Only for destructive actions.

Buttons should always have rounded corners.

10. Icons

Use professional icons.

Avoid emojis inside the interface.

Examples

Upload

Notification

Discussion

Course

Attachment

Reminder

Status

Search

Profile

Settings

Icons should always be paired with labels where appropriate.

11. Navigation

Bottom Navigation

Exactly four items.

Home

Courses

Notifications

Profile

No more in Version 1.

12. Floating Action Button

Always visible.

Bottom-right.

Rounded.

Contains:

Upload icon.

Opens Upload Assignment.

13. Assignment Card

Each card should display:

Course

Title

Due Date

Days Remaining

Discussion Count

Attachment Indicator

Status

Tapping anywhere opens the assignment.

14. Assignment Page

Visual hierarchy:

Header

Question

Attachments

Context

Discussion

Status

AI Help

Emergency Answer

Every section should be clearly separated.

15. Forms

Forms should feel lightweight.

Inputs

Rounded.

Large touch targets.

Helpful placeholders.

Validation messages below inputs.

Avoid long forms.

16. Empty States

Instead of blank pages:

Illustration (optional)

Helpful message

Call-to-action

Example

"No assignments yet."

Upload the first assignment.

17. Loading States

Skeleton cards

Progress bars

Upload indicators

Avoid showing blank white screens.

18. Animations

Animations should be subtle.

Examples

Fade

Slide

Scale

Avoid flashy transitions.

Speed matters more than animation.

19. Notifications

Should feel informative.

Not overwhelming.

Group similar notifications.

Example

"MTH201 has 4 new updates."

instead of

4 individual notifications.

20. Search Experience

Search should begin immediately.

No search button required after typing.

Results update live.

21. Error Messages

Friendly.

Actionable.

Examples

Instead of:

Upload Failed

Use:

"We couldn't upload your assignment.

Check your connection and try again."

22. Accessibility

Good contrast.

Readable fonts.

Large buttons.

Screen-reader friendly labels.

Touch-friendly spacing.

23. Mobile First

Assignment Guy is designed primarily for phones.

Tablet support later.

Desktop support optional.

Every screen should be optimized for vertical scrolling.

24. Dark Mode

Not included in Version 1.

The design system should support adding it later without redesigning every component.

25. Visual Consistency Rules

Every screen must follow the same:

Spacing

Typography

Colors

Buttons

Cards

Icons

Corners

Shadows

Nothing should feel like it belongs to another app.

26. What Version 1 Should NOT Look Like

Avoid the common "AI-generated app" look:

- ✗ Sharp square corners
- ✗ Oversized gradients
- ✗ Random emoji icons
- ✗ Inconsistent spacing
- ✗ Different button styles on every page
- ✗ Huge hero banners
- ✗ Cluttered dashboards
- ✗ Five different shades of blue
- ✗ Tiny tap targets
- ✗ Text-heavy screens

27. UI Quality Checklist

Before every release ask:

- ✓ Does this screen feel simple?
- ✓ Is the primary action obvious?
- ✓ Can a first-time user understand it?
- ✓ Are components consistent?

✓ Is spacing comfortable?

✓ Is anything unnecessary?

If any answer is "No," revisit the design.

End of Document 3

One suggestion before we move on

Up to now, I've intentionally avoided specifying exact pixel values, border radii, colors like #2563EB, or component sizes. That's because those belong in a design token specification, which is even more detailed and useful for developers.

I think we should keep the current UI document as the design philosophy, then later create a separate Design Tokens & Component Library document. That one would define things like:

8px spacing grid

16px border radius

Button heights

Font scale

Color hex codes

Shadows

Icon sizes

Component states (hover, pressed, disabled)

That level of precision helps keep the UI consistent as the app grows without cluttering this higher-level design document. It also gives Replit Agent—or your future Version 2 implementation—a much clearer visual target.
