

😄 We're getting into the "software architect" documents now. These are the ones that tell Replit (or future you) exactly what not to build as much as what to build.

Assignment Guy

Document 7

Version 1 Scope & Functional Specification

Version 1.0

1. Purpose

This document clearly defines what is included in Version 1 and what is intentionally excluded.

Version 1 is an MVP (Minimum Viable Product).

The objective is not to create the perfect assignment platform.

The objective is to determine whether students genuinely find Assignment Guy useful.

Every feature included in Version 1 should contribute directly to that goal.

2. Version 1 Objectives

The application should enable students to:

Know when assignments are given.

Access assignment questions.

Understand assignment context.

Discuss assignments.

Track their progress.

Receive reminders.

Use external AI more efficiently.

Help classmates.

If Version 1 achieves these goals, it is successful.

3. Core User Journey

A student should be able to complete this journey:

Open App

Choose Department

↓

Choose Level

↓

Join Courses

↓

See Assignment Feed

Open Assignment

Read Question

Read Context

Join Discussion

Update Assignment Status

Use AI Help (Optional)

Submit Assignment

Assignment Closes

That is the primary experience.

4. Features Included

AI Help

Launch supported external AI with prepared context.

Emergency Answer

Restricted feature.

Experimental.

Reporting

Basic reporting.

Contributor Recognition

Badges.

Contribution score.

Trusted Contributor.

5. Features NOT Included

To avoid feature creep, Version 1 intentionally excludes:

✗ Chat system

✗ Direct messaging

✗ Lecturer accounts

✗ Timetable

✗ Calendar integration

- ✗ OCR
- ✗ Voice uploads
- ✗ Video uploads
- ✗ Assignment archive
- ✗ Offline uploads
- ✗ Dark mode
- ✗ Gamification
- ✗ Study groups
- ✗ Live collaboration
- ✗ Cloud note taking
- ✗ AI chatbot inside the app

These are future considerations, not Version 1 requirements.

6. Assignment Lifecycle

Every assignment moves through a defined lifecycle.

Draft (optional)

Published

Active

Due Date Reached

Closed

Retention Period

Automatically Deleted

The application is designed around active coursework, not long-term storage.

7. Retention Policy

Assignments are temporary.

Default behavior:

Visible while active.

Hidden after closure.

Retained for a configurable period (for example, 30 days).

Permanently removed afterward.

Future versions may introduce:

Reference Materials.

Lecturer-approved archives.

Past assignment collections.

Version 1 intentionally avoids becoming a permanent repository.

8. Assignment Verification

To improve trust:

Assignments may receive one of the following states:

Unverified

Community Confirmed

Trusted Contributor Verified

Verification indicates confidence that the uploaded assignment matches what was given in class.

Verification does not indicate that answers are correct.

9. Definition of Success

Version 1 succeeds if students naturally begin relying on it during the semester.

Indicators include:

Students checking Assignment Guy before class group chats.

Assignments uploaded quickly after lectures.

Active discussions.

Students returning regularly.

Contributors emerging naturally.

10. User Feedback

Version 1 exists to collect feedback.

Questions to answer:

Which features are used most?

Which features are ignored?

What frustrates students?

What new requests appear repeatedly?

Does Emergency Answer help or harm?

Is AI Help actually useful?

These answers shape Version 2.

11. Out of Scope

The application does not attempt to:

Replace lecturers.

Replace Learning Management Systems.

Replace AI.

Replace studying.

It simply reduces friction around assignments.

12. Product Philosophy Reminder

When deciding whether a new feature belongs in Version 1, ask:

> Does this help students complete assignments more effectively?

If the answer is no, it should probably wait for a future version.

End of Document 7

My thoughts

This document is one of the most valuable for preventing what I call "feature creep." You've had lots of creative ideas throughout our conversations, and that's a strength—but it also means it's easy to keep adding "just one more feature."

This scope document gives you permission to say:

> "That's a great idea... for Version 2."

That discipline is often what separates projects that get released from projects that stay unfinished.

Next Documents

We're now down to the final three major documents:

Document 8 – Version 2 Roadmap (how the platform evolves after validation)

Document 9 – Design Tokens & Component Library (the exact UI specifications: colors, spacing, radii, typography, component states, etc.)

Document 10 – Replit Agent Build Guide & Master Prompt (arguably the most important document for your immediate plan—it tells Replit exactly how to build Assignment Guy while avoiding the common AI-generated project problems you mentioned, like square corners, inconsistent themes, poor architecture, and drifting away from the PRD).

I think that last document will end up being the one you use the most during development.
