

Assignment Guy

Document 17

Version 1.0.1 Project Amendment

Version: 1.0.1

Date: July 2026

Purpose

This document resolves ambiguities, inconsistencies, and missing implementation details identified during the final specification review.

Where this document conflicts with any previous document, this document takes precedence.

All previous documents remain valid unless explicitly modified here.

1. Platform Decision

Version 1 will be developed as a mobile-first Android application using Expo (React Native) with TypeScript.

Reasoning:

- Aligns with the project's original vision.
- Supports modern Android development.
- Can later be expanded to iOS with minimal architectural changes.
- Matches the existing UI and UX specifications.

Version 1 does not target desktop.

2. Authentication Decision

Version 1 will use Supabase Authentication.

Authentication responsibilities:

- Registration
- Login
- Logout
- Session management
- Password recovery

The backend will still expose user-related endpoints (such as profile retrieval and updates), but authentication itself will be handled by Supabase.

3. Feedback System (Official Version 1 Feature)

The Feedback feature is officially included in Version 1.

Purpose:

Allow users to submit:

- Bug Reports
- Feature Suggestions
- UI/UX Feedback
- General Feedback
- Incorrect Information Reports

Database addition:

Feedback Table

Suggested fields:

- feedback_id
- user_id (nullable for anonymous feedback if enabled later)
- category
- title
- description
- screenshot_url (optional)
- device_info (optional)
- status
- created_at

API additions:

- Submit Feedback
- Retrieve Feedback (Admin)
- Update Feedback Status (Admin)

4. Assignment Helpfulness Rating

Each assignment includes a lightweight usefulness rating.

Users may select:

 Helpful

 Not Helpful

This is not a popularity system.

Its purpose is to identify assignments that require correction or improvement.

The rating should not dominate the interface.

5. Assignment Verification

Version 1 officially includes assignment verification.

Verification states:

- Unverified
- Community Confirmed
- Trusted Contributor Verified

Verification indicates confidence that the uploaded assignment matches the lecturer's original assignment.

Verification does not indicate correctness of answers.

6. Admin Dashboard

Version 1 includes a hidden administrator interface.

The administrator interface is not accessible to normal users.

It should support:

- View Reports
- Review Feedback
- Manage Assignments
- Moderate Discussions
- Manage Trusted Contributors
- Review Verification Requests

This interface may exist as a protected route or secured admin screen.

7. AI Help Clarification

Version 1 does not include built-in AI.

AI Help performs the following actions:

- Collect assignment question.
- Collect assignment context.
- Collect submission instructions.
- Format the information.
- Copy the formatted prompt to the clipboard.
- Allow the user to launch their preferred external AI service.

Supported providers should be configurable.

No external AI APIs are required.

8. Discussion Comment Types

Discussion comments now support optional categories.

Examples:

- Question
- Answer
- Suggestion

- Correction
- Announcement

This field should be optional.

9. Upload Limits

Default upload limits:

Images:

Maximum 10 MB

PDF:

Maximum 25 MB

Additional limits may be configured without changing application logic.

10. Assignment Lifecycle

Assignment lifecycle remains:

Published

↓

Active

↓

Closed

↓

Retention Period

↓

Automatic Removal

Default retention period:

30 days

This value should remain configurable.

11. Emergency Answer

Emergency Answer remains an experimental Version 1 feature.

Its unlocking rules are intentionally configurable.

The backend is solely responsible for determining eligibility.

The implementation should avoid hardcoding restrictive business rules so they can evolve based on real user feedback.

12. Contribution Score

Initial contribution scoring should be configurable.

The exact values are intentionally left adjustable and should not be hardcoded throughout the application.

A central configuration should control contribution weights.

13. Helpful Architecture Reminder

Business logic belongs in the backend.

Presentation belongs in the frontend.

Authentication belongs to Supabase.

UI components should remain reusable.

Avoid unnecessary complexity.

14. Minor Corrections

The Product Requirements Document feature count should be corrected to accurately reflect all documented Version 1 features.

Any references implying a web-first implementation should be interpreted as mobile-first React Native implementation.

Final Amendment

This document represents the latest agreed-upon decisions for Assignment Guy Version 1.

It supplements the existing documentation rather than replacing it.

Future amendments should continue this versioning approach.
