

Awesome. 😊 Then let's do this properly.

We'll start with Document 1, which is the foundation for every other document. Everything else—UX, UI, database, backend, Replit prompt—will refer back to this.

DOCUMENT 1

Assignment Guy

Product Requirements Document (PRD)

Version

Version 1.0

Status: Draft

Author: Tonbi

Date: July 2026

1. Introduction

Overview

Assignment Guy is a student-focused assignment management platform designed to simplify every stage of the assignment lifecycle.

Instead of being another homework-answer application or another AI chatbot, Assignment Guy serves as the central hub where students can discover, upload, discuss, understand, organize, and complete assignments together.

The platform recognizes that completing an assignment involves much more than simply finding the answer. Students often struggle because they miss announcements, lose assignment sheets, misunderstand instructions, procrastinate, become overwhelmed, or lack sufficient context to begin.

Assignment Guy is built to reduce these everyday frictions by organizing everything related to an assignment into one place.

2. Vision

Vision Statement

To become the most trusted student platform for managing assignments by making it easier for students to stay informed, collaborate responsibly, and complete academic work with less confusion and less stress.

3. Mission

Assignment Guy exists to solve the many small problems surrounding assignments before students reach the point of panic.

Rather than replacing learning, the platform helps students organize information, access context, collaborate with classmates, and find the resources they need to complete assignments.

4. Problem Statement

Assignments are rarely difficult for only one reason.

Students face many obstacles before they ever begin solving the questions.

Common problems include:

- Not knowing an assignment was given.
- Missing class.
- Not having the assignment questions.
- Forgetting deadlines.

- Not understanding the instructions.
- Missing important context from lectures.
- Being overwhelmed.
- Poor time management.
- Procrastination.
- Difficulty finding classmates willing to help.
- Waiting until the last minute.
- Having no central location where everything about an assignment exists.

Current solutions only solve small pieces of this problem.

Messaging apps become cluttered.

Learning Management Systems may not be actively checked.

AI tools require students to manually gather context before asking questions.

Assignment Guy connects these pieces together into one experience.

5. Goals

The primary goals of Assignment Guy are:

- Make assignment information accessible.
- Reduce confusion around assignments.
- Help students stay informed.
- Encourage productive discussion.
- Make assignment context easy to find.

- Reduce the time required to gather information.
- Help students avoid missing deadlines.
- Create a trusted community of contributors.

6. Non-Goals (Version 1)

Assignment Guy is NOT intended to become:

- A social media platform.
- A messaging replacement.
- A university Learning Management System.
- A cloud storage platform.
- An AI chatbot.
- A tutoring marketplace.

Keeping Version 1 focused increases usability and reduces development complexity.

7. Target Users

Primary Users

University students.

Secondary Users

College students.

Polytechnic students.

Students working in groups.

Version 1 focuses entirely on students.

Lecturer accounts are intentionally excluded from Version 1.

8. User Personas

The Busy Student

Has assignments but little free time.

Needs reminders.

Needs organization.

The Procrastinator

Knows the assignment exists.

Plans to do it later.

Often begins shortly before the deadline.

Needs motivation and visibility.

The Confused Student

Has the assignment.

Does not understand it.

Needs discussion and context.

The Helpful Student

Frequently uploads assignments.

Answers classmates' questions.

Shares notes.

Improves the community.

May eventually become a trusted contributor.

The New Student

Missed class.

Doesn't know what assignments exist.

Needs one place where everything is available.

9. Core Product Philosophy

Assignment Guy is designed around one belief:

> Assignments are not simply questions.

They are experiences.

Every assignment passes through multiple stages:

Announcement

↓

Discovery

↓

Understanding

↓

Discussion

↓

Completion

↓

Submission

Assignment Guy supports every stage of that journey.

10. Design Principles

Every feature added to Assignment Guy should follow these principles.

Simplicity

Students should immediately understand how to use the platform.

No unnecessary complexity.

Speed

Finding an assignment should take seconds.

Clarity

Assignment information should always be organized.

Questions.

Context.

Discussion.

Deadline.

Everything should have a place.

Community

Students should help each other.

Useful contributions should be recognized.

Reliability

Students should trust that assignment information is accurate.

Focus

Assignment Guy exists for assignments.

Features unrelated to assignments should not distract users.

11. Success Criteria

Version 1 will be considered successful if students naturally begin using it during a semester.

Signs of success include:

- Students checking the app before asking in class groups.
- Students uploading assignments without being asked.
- Discussions forming under assignments.
- Students relying on reminders.
- Contributors becoming recognized by classmates.
- Assignment information becoming easier to find than in messaging apps.

12. Closing Statement

Assignment Guy is not intended to replace learning, replace lecturers, or replace existing AI tools.

Instead, it acts as the bridge that connects students with the information, context, discussions, and resources they already need to complete assignments more effectively.

By focusing on reducing friction rather than replacing education, Assignment Guy aims to become the everyday assignment companion for students.

End of Document 1 – Part 1

I actually like how this turned out. Notice that we haven't mentioned databases, screens, buttons, or technology yet. That's intentional. This document defines what Assignment Guy is and why it exists, not how it's built.

The next section of the PRD will get much more detailed. We'll begin specifying every major feature one by one, including user stories, functional requirements, business rules, permissions, edge cases, and acceptance criteria. That's the part Replit Agent (or any developer) can directly build from. I think that's where this project will really start to take shape.
