

Perfect. This next document is one of the most important because it defines how the app feels. A product with great features but poor UX often fails because people don't enjoy using it.

Assignment Guy

Document 2

User Experience (UX) Specification

Version 1.0

1. UX Philosophy

Assignment Guy is designed around one core principle:

> Students should spend their time completing assignments, not searching for information about them.

Every interaction should reduce friction.

The interface should feel calm, clean, and predictable.

Students should never wonder:

Where is the assignment?

Where is the discussion?

Where is the deadline?

Everything should be obvious.

2. UX Principles

Every screen must follow these principles.

Fast

The user should reach an assignment within two or three taps.

Simple

Avoid unnecessary menus.

Avoid hidden functionality.

Keep actions obvious.

Familiar

Navigation should feel similar to modern mobile apps.

No learning curve.

Focused

Only show information relevant to the assignment.

Avoid unnecessary distractions.

Consistent

Buttons behave consistently.

Cards look consistent.

Spacing remains consistent.

Icons remain consistent.

3. First-Time User Journey

Step 1

Open app.

Welcome Screen.

Brief explanation.

Sign Up / Log In.

Step 2

Choose school.

Choose department.

Choose level.

Join courses.

Example

University

↓

Computer Engineering

↓

Year Two

↓

MTH201

↓

CPE203

↓

GST202

This creates a personalized feed immediately.

4. Home Screen

The Home Screen is the Assignment Feed.

Purpose:

Show every important assignment.

Each Assignment Card displays:

Course

Title

Due Date

Days Remaining

Status

Attachment indicator

Discussion count

No unnecessary information.

5. Bottom Navigation

Version 1 should only contain four tabs.

Home

Courses

Notifications

Profile

That's all.

Avoid adding more tabs until genuinely needed.

6. Floating Action Button

One floating button.

Upload Assignment.

Visible throughout the app.

7. Home Flow

Student opens app.

Newest assignments appear.

Student taps assignment.

Assignment Page opens.

Simple.

8. Assignment Page

This is the most important page in the app.

Everything revolves around it.

Layout:

Header

Assignment Title

Course

Due Date

Status

Question

Attachments

Context

Discussion

Assignment Status

AI Help

Emergency Answer

No hidden pages.

No unnecessary navigation.

Everything should exist in one scrollable page.

9. Upload Flow

Student taps

Choose Upload Type

Photo

PDF

Text

Fill Details

Preview

Publish

Assignment appears in feed.

The upload process should take under one minute.

10. AI Help Flow

Student opens assignment.

Tap AI Help.

System prepares:

Question

Context

Attachments (where possible)

Instructions

Student chooses AI.

External AI opens.

Student returns.

The app itself never behaves like a chatbot.

11. Discussion Flow

Student opens Discussion.

Reads existing posts.

Writes comment.

Posts.

Replies appear instantly.

Discussions should feel lightweight, not like a forum with endless nested replies.

12. Assignment Status Flow

Student taps Status.

Choose:

Not Started

In Progress

Finished

Submitted

Dashboard updates.

Done.

13. Notification Flow

Notification arrives.

↓

Tap notification.

↓

Open correct assignment.

Never make users search after tapping a notification.

14. Search Flow

Tap Search.

↓

Type:

Course

Assignment

Topic

↓

Results appear instantly.

↓

Tap result.

Assignment opens.

15. Empty States

Instead of blank screens:

Use helpful messages.

Example

"No assignments yet."

"Be the first to upload one."

Another example

"No discussions yet."

"Start the conversation."

16. Error States

Errors should explain:

What happened.

Why.

How to fix it.

Avoid messages like

"Unknown Error."

Instead:

"Upload failed. Check your connection and try again."

17. Loading States

Never leave users wondering.

Show:

Loading placeholders (skeleton screens)

Progress indicators for uploads

Loading spinners only when necessary

18. Permissions

When requesting:

Camera

Photos

Notifications

Explain why before asking.

Example:

"We use notifications to remind you about assignment deadlines."

19. Accessibility

Minimum touch targets

Readable font sizes

Good contrast

Icons always have labels

Support system dark mode later

Version 1 should already be usable for most users.

20. User Frustration Rules

Never make users:

Search for deadlines.

Search for attachments.

Search for discussions.

Search for context.

Everything should exist inside the Assignment Page.

21. Version 1 UX Goals

A new student should be able to:

Sign up.

Join courses.

Find an assignment.

Upload one.

Comment.

Update status.

Use AI Help.

...without reading instructions.

If users need a tutorial for basic tasks, the UX needs improvement.

End of Document 2 – Part 1

Notes

While writing this, one design choice became very clear: the Assignment Page is the product.

The Home screen just gets students there.

Notifications bring them there.

Search finds it.

Discussions live there.

Context lives there.

AI Help starts there.

Status updates happen there.

Almost everything points to one destination. That's a good sign because it keeps the app mentally simple. Students don't have to remember where features are—they learn one central place, and everything important is there.

Next, we'll dive into the UI Design System—colors, typography, spacing, buttons, cards, icons, animations, light/dark mode, and the visual identity that makes Assignment Guy feel polished instead of like a generic generated app. That's where we can reflect your preference for clean layouts, rounded corners, and a modern feel.
